

Abstract of the Disclosure

Systems and methods provide network address failover capability within an
5 application gateway device. In one aspect, a system has a first network interface and a second
network interface. The system receives a set of configuration data, the configuration data may
include a first network address for the first network interface and a second network address
for the second network interface. At startup or during later operation, the system may detect
the failure of the first network interface. The configuration data may be analyzed to determine
10 if the first network address can be used on the second network interface. If so, the first
network address is moved from the first network interface to the second network interface.
